# Application Platforms & Data Services. Automated.

Let your engineers build. We'll handle the maintenance.
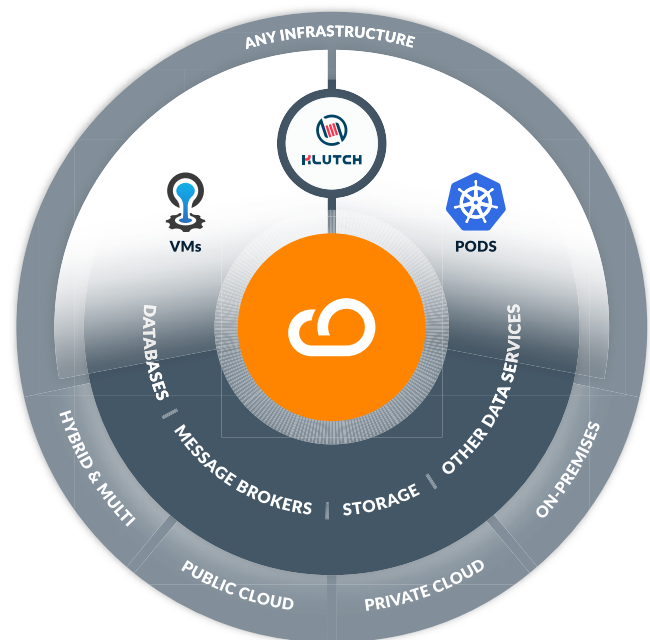

anynines

anynines

Since 2013, German-headquartered anynines has helped organizations automate cloud-native application platforms and data services across VMs, Kubernetes, and hybrid environments. We are here to help deliver automation with compliance, security, and scale in mind.

We're contributors to Cloud Foundry, maintainers of Klutch—the open-source database orchestration tool for Kubernetes—and trusted by many partners and enterprises to help modernize infrastructure without losing control.

Why anynines?

Platform and application teams still spend too much time managing their platform, databases and other data services instead of driving real value. Stop handling backups, patching, upgrades, and monitoring. Focus on high-impact work while we handle the operational overhead.

Manual processes and fragmented tooling slow teams down and increase risk. Whether you're working in a highly regulated industry or supporting thousands of internal developers, you need reliable automation across your environments.

DEPLOY ON

aws · Google Cloud · vmware by Broadcom · Microsoft Azure · On-prem · + more

- Standardize how services are provisioned and managed across platforms
- Deliver self-service access to essential databases and data services
- Migrate legacy platforms gradually without service disruption
- Maintain EU data residency & compliance needs like ISO 27001

Refocus on innovation

Free your engineers from infrastructure upkeep and let them innovate and accelerate delivery.

Standardize & secure

Consistent, policy-driven automation for data services: SQL & NoSQL DBs, caching & storage, messaging, logging & observability, and more.

Control costs at scale

Infrastructure-agnostic automation brings predictability and visibility across hybrid setups.

Our offerings

a9s Cloud Foundry

Managed Cloud Foundry application platform built for scale. We handle upgrades, security, and day-2 ops thus reducing your risk and exposure so your devs can focus on apps.

Klutch

Open-source control plane that lets developers provision and manage any database or data service in Kubernetes clusters—VM-based or Kubernetes-native—via YAML specs as if they were local. Hello, developer self-service! Learn more at klutch.io.

a9s Hub

A modular app console that delivers fast, responsive management of Cloud Foundry, Kubernetes, and multi-cluster environments through customizable plugins.
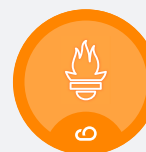

a9s Data Services

Lifecycle automation for PostgreSQL, OpenSearch, MongoDB, MariaDB, Valkey, Prometheus, RabbitMQ, and more—proven on VMs, and deployable on K8s with Klutch.

a9s PostgreSQL

a9s Prometheus

a9s LogMe2

a9s MongoDB

a9s Messaging

a9s KeyValue

a9s Search

a9s MariaDB

a8s PostgreSQL
