

PRODUCT & SERVICE PORTFOLIO

Less operational overhead. More time for your product.

Automated application platforms, self-service databases, and data services with full lifecycle automation. So your engineering teams build products, not patch infrastructure.

The cost of doing it manually

Your platform team spends more time on backups, patching, and monitoring than on the things that actually move your product forward. Every manual

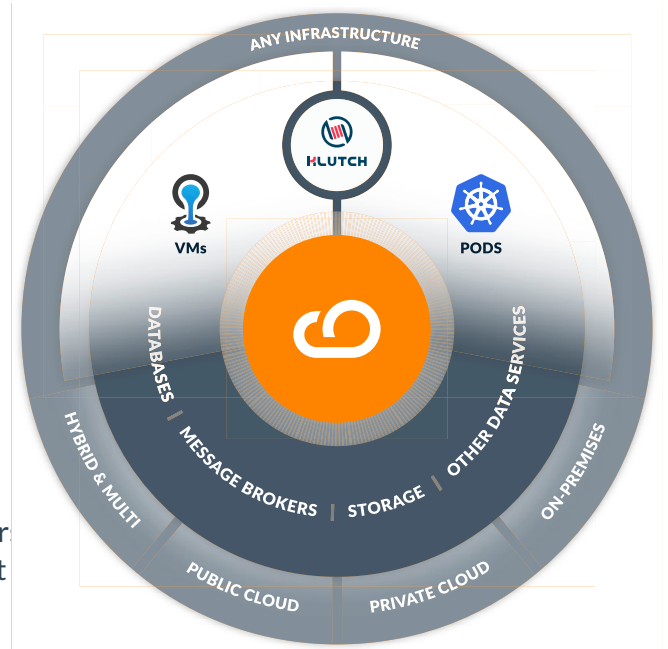

database operation is an hour not spent on your roadmap and a risk that gets expensive at audit time or during a security incident.

Since 2013

German-headquartered anynines has helped organizations automate cloud-native application platforms, databases, and data services across VMs, Kubernetes, and hybrid environments with compliance, security, and scale in mind.

We're contributors to the Cloud Foundry ecosystem, maintainers of Klutch, the open-source database orchestration tool for Kubernetes, and trusted by partner and enterprises to help modernize infrastructure without losing control.

Why anynines?

Time back for your team

Your engineers stop managing infrastructure and start building product. That means faster releases, fewer context switches, and more focus on what really matters to customers.

One standard instead of a patchwork

Consistent, policy-driven automation for SQL and NoSQL databases, caching, messaging, logging, and observability. That means fewer edge cases, less audit overhead, and one security baseline across every service.

Costs that stay predictable

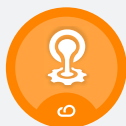

Infrastructure-agnostic automation across hybrid setups. That means you keep control of cost and capacity even as your environment grows or changes.

RUNS ON

- ✓ Standardize service provisioning and lifecycle management across platforms
- ✓ Provide self-service access to essential databases and data services
- ✓ Modernize legacy platforms gradually without disrupting services
- ✓ Retain control over EU data residency with an ISO 27001-certified European provider

Our solutions

a9s Cloud Foundry

So your team never loses a night to an upgrade again: a fully managed Cloud Foundry platform where we handle upgrades, security, and day-2 ops.

a9s Hub

Built for mid-sized businesses and large enterprises, a9s Hub combines developer self-service with centralized governance and compliance to manage data services at scale. It comes with automation backends for VM-based services, container-based services on Kubernetes, including on-premises deployments, and Amazon RDS.

CF AppStage

CF AppStage gives developers and platform teams direct, fast access to apps, services, and resources in their Cloud Foundry environments, with guided workflows that remove CLI dependency for routine operations. The console is modular, built on Backstage, and leverages the Cloud Foundry API v3, so teams can add exactly the plugins their workflows need.

Klutch

Open-source control plane that enables self-service data services across Kubernetes fleets while maintaining centralized control. Pluggable automation backends manage the full service lifecycle.

a9s Data Services

Lifecycle automation for PostgreSQL, OpenSearch, MongoDB, MariaDB, Valkey, Prometheus, RabbitMQ, and Metrics—proven on VMs, and deployable on Kubernetes with Klutch.

a9s PostgreSQL

a9s Prometheus

a9s LogMe2

a9s MongoDB

a9s Messaging

a9s Key/Value

a9s Search

a9s MariaDB

a9s Enterprise Platform Operations (EPO)

Entrust the operation of your Cloud Foundry or Kubernetes platform to a team with extensive experience working with environments at global businesses. Our EPO team delivers platform automation covering the whole lifecycle of your environment, including but not limited to setup, monitoring, updates and security patches, system component backups, as well as other services like Cloud Foundry migrations, so your teams can focus entirely on your applications instead of having to keep up with infrastructure maintenance.

PROUD MEMBER OF

Built on open standards, not a black box

- Contributors to the Cloud Foundry ecosystem
- Maintainers of Klutch, the open-source database orchestration tool for Kubernetes
- European-built technology that keeps you in control of your infrastructure and data
- Certified according to ISO/IEC 27001:2022
